

# Washing Container

Model: CL-21

*a measurable difference...*

The washing container CL-21 was designed to optimize the washing of pulps and wood chips coming from laboratory digesters, overheated and impregnated in black liquor.

Entirely built in stainless steel the CL-21 resists the intensive washing of digested pulps, enabling users to safely separate the solids from the black liquor resulting for digestion of wood chips for pulp production.

The bottom of the washing container is a fine retaining wire screen mesh supported by a rugged perforated plate. This assembly retains all solid materials while all black liquor is washed away through it by the flushing water

## Technical Specifications:

- Washing Area: 375mm x 375mm
- Washing Volume: 40L
- Retaining Wire Screen Gauze: #100/in
- Supporting Perforated Plate: Holes Ø 3.2mm

## Options:

- Additional Interchangeable wire screen gauzes of #80/in, #150/in and #200/in

## Dimensions:

- **H:** 400mm
- **W:** 425mm
- **D:** 425mm
- **Weight:** 15kg
